

Amendments to the Claims:

Please cancel claims 23-25 without prejudice or disclaimer. This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method of updating a supply plan used to process customer requests in an available-to-promise (ATP) system, the method comprising:

a supply chain planning component of the ATP system updating a model of a supply chain for one or more products sold by the ATP system;

the supply chain planning component of the ATP system copying a current supply plan used in use by the ATP system to process customer requests ~~to create and creating~~ a second supply plan within the ATP system while the ATP system continues to process orders based on the current supply plan, wherein the second supply plan is different from the first supply plan; ~~thereafter, and wherein continuing to process orders based on the current supply plan comprises~~ receiving a first plurality of customer requests at the ATP system and processing orders from the requests against the current supply plan with the ATP system while running the model of the supply chain with the second supply plan as part of a process that creates a new supply plan in the ATP system;

after the new supply plan is created in the ATP system, an order processing component of the ATP system continuing to process orders while replacing the current supply plan with the new supply plan by promising orders based on the new supply plan and a ~~synchronization program of the ATP system~~ synchronizing the new supply plan by processing with the ATP system orders from the first plurality of customer requests scheduled against the current supply plan into the new supply plan while continuing to promise orders based on the new supply plan, wherein the synchronizing process is stopped prior to synchronizing all the orders in the first plurality of requests into the new supply plan; thereafter, temporarily stopping

promising orders with the ATP system while synchronizing with the ATP system all remaining orders from the first plurality of requests not synchronized during the synchronizing process into the new supply plan; and after the remaining orders from the first plurality of requests are processed with the ATP system, replacing the current supply plan used by the ATP system with the new supply plan so that the ATP system processes future customer requests against the new supply plan.

2. (Previously Presented) The method of claim 1 wherein the step of replacing the current supply plan with the new supply plan is performed by changing a pointer to the new supply plan and setting a flag associated with the new supply plan to indicate that the new supply plan is available for ATP processing.

3. (Previously Presented) The method of claim 1 wherein an exception is generated if a promise made against the current supply plan cannot be made against the new supply plan.

4. (Original) The method of claim 3 wherein the exception causes a message to be generated and available to a planner for processing.

5. (Original) The method of claim 3 wherein the exception causes a message to be sent to a planner for processing.

6. (Previously Presented) The method of claim 1 wherein the step of synchronizing the new supply plan with the current supply plan comprises stopping synchronization when it is determined that a predetermined number of requests still need to be synchronized.

7. (Currently Amended) The method of claim 6 wherein the predetermined number is calculated by the ATP system ~~to~~ based on an average time of synchronizing each request and a desired system downtime entered by a planner.

8. (Original) The method of claim 1 further comprising, prior to running the model, capturing a snapshot of data representing actual sales and promised requests for use in creation of the new supply plan.

9. (Original) The method of claim 1 further comprising creating a summary table from the new supply plan that can be used by the ATP system to quickly retrieve summarized availability information without computing availability from more detailed supply and demand tables.

10. (Original) The method of claim 1 further comprising pre-allocating products available for promising in the new supply plan in accordance with previously defined business objectives of an organization.

11. (Previously Presented) The method of claim 1 further comprising, after replacing the current supply plan with the new supply plan, receiving a second plurality of customer requests by the ATP system and promising orders from the second plurality of requests against the new supply plan.

12. (Previously Presented) The method of claim 1 wherein the synchronizing process is stopped when a number of outstanding orders not synchronized into the new plan reaches a threshold number.

13. (Original) The method of claim 12 wherein the threshold is a user defined threshold.

14.-15. (Canceled)

16. (Currently Amended) An available-to-promise (ATP) system for processing customer requests, the system comprising:

one or more items of hardware operable to execute one or more components, the components comprising:

a supply chain planning component configured to allow a planner to update a model of a supply chain for one or more products sold by the ATP system; and

an order promising component configured to allow a planner to update a current supply plan used in use to process requests with a new supply plan by

copying ~~[[a]]~~ the current supply plan used in use by the ATP system to process customer requests ~~to create~~ and creating a second supply plan;

thereafter, while the ATP system continues to process orders based on the current supply plan and wherein continuing to process orders based on the current supply plan comprises receiving a first plurality of customer requests at the ATP system and promising orders from the first plurality of requests against the current supply plan while the ATP system runs the model of the supply chain process with the second supply plan as part of a process that creates a new supply plan;

after the new supply plan is created, continuing to process orders while replacing the current supply plan with the new supply plan and synchronizing orders from the first plurality of customer requests scheduled against the current supply plan into the new supply plan by processing a first subset of the plurality of customer requests against the new supply plan until a threshold number of orders in the first plurality of requests is reached;

stopping synchronization of orders of the first plurality of customer requests prior to synchronizing all the orders of the first plurality of customer requests while continuing to process new customer requests received at the ATP system against the new supply plan;

thereafter, temporarily stopping promising orders from new customer requests received at the ATP system while checking all remaining orders from the first plurality of requests not checked during the synchronizing process against the new supply plan; and

after the remaining orders from the first plurality of requests are processed, switching the new supply plan for the current supply plan so that the ATP system can process future customer requests against the new supply plan.

17. (Original) The system of claim 16 further comprising a demand planning component configured to allow a planner to create a demand plan that can be used by the supply chain planning component to model a supply chain.

18. (Original) The system of claim 16 wherein the threshold number is a user defined limit.

19. (Previously Presented) The method of claim 1 further comprising synchronizing a first subset of the second plurality of requests scheduled against the current supply plan into the new supply plan by processing the second plurality of requests against the new supply plan.

20. (Previously Presented) The method of claim 19 further comprising:
temporarily stopping promising orders; and
synchronizing all remaining requests from the second plurality of requests not synchronized during the synchronizing the first subset.

21. (Previously Presented) The method of claim 1, wherein the synchronization process is stopped prior to synchronizing a predetermined number of orders remaining in the first plurality of requests taken after a predetermined time.

22. (Previously Presented) The method of claim 1, wherein the synchronization process is stopped prior to synchronizing a predetermined number of orders in the first plurality of requests based on a predetermined percentage of orders that can be processed in a predetermined period of time.
